

# Problem Set 1: Matrix Algebra Review

Stat 154, Spring 2018, Prof. Sanchez

*Due date: Fri Feb-02 (before midnight)*

The purpose of this assignment is to apply in R some of the introductory material, giving you the opportunity to do some work with matrices and vectors.

Use an R markdown (`.Rmd`) file to write your code and answers. You can *knit* the `Rmd` file as html or pdf. Please submit both your `Rmd` and knitted file to bCourses. Make sure to include your name, and your lab section. If you haven't, please take some time to review the policies about the HW assignments:

<https://github.com/ucb-stat154/stat154-spring-2018/blob/master/syllabus/policies.md#assignments>

## Problem 1 (10 pts)

Create the following matrices in R (and display them).

$$\mathbf{X} = \begin{bmatrix} 2 & 3 \\ -1 & 4 \end{bmatrix}; \quad \mathbf{Y} = \begin{bmatrix} 2 & 0 & 1 \\ 1 & -2 & 3 \end{bmatrix}; \quad \mathbf{Z} = \begin{bmatrix} 1 & 1 \\ -1 & 1 \\ 0 & 2 \end{bmatrix}; \quad \mathbf{W} = \begin{bmatrix} 1 & 0 \\ 8 & 3 \end{bmatrix}; \quad \mathbf{I} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

## Problem 2 (10 pts)

Use the matrices created in Problem 1 to perform each of the following operations in R. If the indicated operation cannot be performed, explain why.

- $\mathbf{X} + \mathbf{Y}$
- $\mathbf{X} + \mathbf{W}$
- $\mathbf{X} - \mathbf{I}$
- $\mathbf{XY}$
- $\mathbf{XI}$
- $\mathbf{X} + (\mathbf{Y} + \mathbf{Z})$
- $\mathbf{Y}(\mathbf{I} + \mathbf{W})$

### Problem 3 (10 pts)

Determine whether the following statements are True or False.

- a. Every orthogonal matrix is nonsingular.
- b. Every nonsingular matrix is orthogonal.
- c. Every matrix of full rank is square.
- d. Every square matrix is of full rank.
- e. Every nonsingular matrix is of full rank.

### Problem 4 (10 pts)

Let  $\mathbf{X}$ ,  $\mathbf{Y}$ , and  $\mathbf{Z}$  be conformable. Using the properties of transposes, prove that:

$$(\mathbf{XYZ})^T = \mathbf{Z}^T \mathbf{Y}^T \mathbf{X}^T$$

### Problem 5 (10 pts)

Consider the eigenvalue decomposition of a symmetric matrix  $\mathbf{A}$ . Prove that two eigenvectors  $\mathbf{v}_i$  and  $\mathbf{v}_j$  associated with two distinct eigenvalues  $\lambda_i$  and  $\lambda_j$  of  $\mathbf{A}$  are mutually orthogonal; that is,  $\mathbf{v}_i^T \mathbf{v}_j = 0$

### Problem 6 (20 pts)

Refer to the Gram-Schmidt orthonormalization process described in the following wikipedia entry:

[https://en.wikipedia.org/wiki/Gram%E2%80%93Schmidt\\_process](https://en.wikipedia.org/wiki/Gram%E2%80%93Schmidt_process)

This procedure is a method for orthonormalizing a set of vectors in an inner product space. In other words, it allows you to find an orthogonal basis for a set of vectors.

The *projection operator* is given by:

$$proj_{\mathbf{u}}(\mathbf{v}) = \frac{\langle \mathbf{u}, \mathbf{v} \rangle}{\langle \mathbf{u}, \mathbf{u} \rangle} \mathbf{u}$$

This projector operator projects the vector  $\mathbf{v}$  orthogonally onto the line spanned by vector  $\mathbf{u}$ .

### 6.1 Function `inner_product` (10 pts)

Write an R function `inner_product()` that calculates the inner product  $\langle \mathbf{u}, \mathbf{v} \rangle$  of two vectors (of the same length)  $\mathbf{u}$  and  $\mathbf{v}$ .

Given two vectors  $\mathbf{v}$  and  $\mathbf{u}$ , you should be able to invoke your function like:

```
inner_product(v, u)
```

Test `inner_product(v, u)` with  $\mathbf{v} = (1, 3, 5)$  and  $\mathbf{u} = (1, 2, 3)$

### 6.2 Function `projection` (10 pts)

Use your `inner_product()` function to write an R function `projection()` for the projection operator.

Given two vectors  $\mathbf{u}$  and  $\mathbf{v}$ , you should be able to call your function like:

```
projection(v, u)
```

Test `projection(v, u)` with  $\mathbf{v} = (1, 3, 5)$  and  $\mathbf{u} = (1, 2, 3)$

## Problem 7 (10 pts)

Refer to the same wikipedia entry of the previous question. Once you have your function `projection()`, write R code to apply the Gram-Schmidt orthonormalization procedure to the following sets of vectors:

$\mathbf{x} = (1, 2, 3)$ ;  $\mathbf{y} = (3, 0, 2)$ ;  $\mathbf{z} = (3, 1, 1)$

Start by setting  $\mathbf{u}_1 = \mathbf{x}$ , and report the set of vectors  $\mathbf{u}_k$  and the orthonormalized vectors  $\mathbf{e}_k$ , for  $k = 1, 2, 3$ .

## Problem 8 (10 pts)

The length of a vector  $\mathbf{x} = (x_1, x_2, \dots, x_n)$  in the  $n$ -dimensional real vector space  $\mathbb{R}^n$  is usually given by the Euclidean norm:

$$\|\mathbf{x}\| = (x_1^2 + x_2^2 + \dots + x_n^2)^{1/2}$$

In many situations, the Euclidean distance is insufficient for capturing the actual distances in a given space. The class of  $p$ -norms generalizes the notion of *length* of a vector and it is defined by:

$$\|\mathbf{x}\|_p = (|x_1|^p + |x_2|^p + \cdots + |x_n|^p)^{\frac{1}{p}}$$

where  $p$  is a real number  $\geq 1$ .

Write a function `lp_norm()` that computes the  $L_p$ -norm of a vector. This function should take two arguments:

- `x` the input vector
- `p` the value for  $p$
- Give `p` a default value of 1
- Allow the user to specify `p = "max"` to compute the  $L_\infty$ -norm

You should be able to call `lp_norm()` like this:

```
lp_norm(x)           # default p = 1
lp_norm(x, p = 2)
lp_norm(x, p = "max") # L-max norm
```

## Problem 9 (10 pts)

Use your function `lp_norm()` with the following vectors and values for `p`:

- `zero <- rep(0, 10)` and `p = 1`
- `ones <- rep(1, 5)` and `p = 2`
- `u <- rep(0.4472136, 5)` and `p = 2`
- `u <- 1:500` and `p = 100`
- `u <- 1:500` and `p = "max"`

## Problem 10 (10 pts)

Consider the eigendecomposition of a square matrix  $\mathbf{A}$ .

- Prove that the matrix  $b\mathbf{A}$ , where  $b$  is an arbitrary scalar, has  $b\lambda$  as an eigenvalue, with  $\mathbf{v}$  as the associated eigenvector.
- Prove that the matrix  $\mathbf{A} + c\mathbf{I}$ , where  $c$  is an arbitrary scalar, has  $(\lambda + c)$  as an eigenvalue, with  $\mathbf{v}$  as the associated eigenvector.

## Problem 11 (20 pts)

For this problem, use the data set `state.x77` that comes in R.

- Select the first five columns of `state.x77` and convert them as a matrix; this will be the data matrix  $\mathbf{X}$ . Let  $n$  be the number of rows of  $\mathbf{X}$ , and  $p$  the number of columns of  $\mathbf{X}$ .
- Create a diagonal matrix  $\mathbf{D} = \frac{1}{n}\mathbf{I}$  where  $\mathbf{I}$  is the  $n \times n$  identity matrix. Display the output of `sum(diag(D))`.
- Compute the vector of column means  $\mathbf{g} = \mathbf{X}^T \mathbf{D} \mathbf{1}$  where  $\mathbf{1}$  is a vector of 1's of length  $n$ . Display (i.e. print)  $\mathbf{g}$ .
- Calculate the mean-centered matrix  $\mathbf{X}_c = \mathbf{X} - \mathbf{1}\mathbf{g}^T$ . Display the output of `colMeans(Xc)`.
- Compute the (population) variance-covariance matrix  $\mathbf{V} = \mathbf{X}^T \mathbf{D} \mathbf{X} - \mathbf{g}\mathbf{g}^T$ . Display the output of  $\mathbf{V}$ .
- Let  $\mathbf{D}_{1/S}$  be a  $p \times p$  diagonal matrix with elements on the diagonal equal to  $1/S_j$ , where  $S_j$  is the standard deviation for the  $j$ -th variable. Display only the elements in the diagonal of  $\mathbf{D}_{1/S}$ .
- Compute the matrix of standardized data  $\mathbf{Z} = \mathbf{X}_c \mathbf{D}_{1/S}$ . Display the output of `colMeans(Z)` and `apply(Z, 2, var)`.
- Compute the (population) correlation matrix  $\mathbf{R} = \mathbf{D}_{1/S} \mathbf{V} \mathbf{D}_{1/S}$ . Display the matrix  $\mathbf{R}$ .
- Confirm that  $\mathbf{R}$  can also be obtained as  $\mathbf{R} = \mathbf{Z}^T \mathbf{D} \mathbf{Z}$ .

## Comments and Reflections

Reflect on what was hard/easy, helpful tutorials you read, etc. Here are some questions that you can start with to provide comments on your HW.

- What things were hard, even though you saw them in class?
- What was easy(-ish) even though we haven't done it in class?
- Did you need help to complete the assignment? If so, what kind of help? Who helped you?
- How much time did it take to complete this HW?
- What was the most time consuming part?
